Reading 2. Information Technolog	gy
What is Information Technology	
Information Technology (IT) is the a computers and internet to store, retrieve, manipulate information, often in the obusiness or other enterprise. IT is considered information and communications technology	transmit, and context of a red a subset of
has evolved according to the needs.	

software, electronics, semiconductors, internet, telecom equipment, engineering, healthcare, e-commerce, and computer services.

Thanks to the continuous development of computers, the original computing systems became minicomputers and later personal computers took the lead. Nowadays, mobile phones are dethroning the personal computer and computing is evolving faster to become disembodied more like a **cloud**, becoming accessible more easily whenever needed. Information technology has transformed people and companies and has allowed digital technology to influence society and economy alike. It has, in this sense, shaped societies and adapted itself to people's needs.

History

If you want a brief history of Information Technology, here is one. Humans were the first "computers". Then, machines were invented to carry out the computational tasks. Now these machines have given way to new form of information technology. Information has become disembodied accessible from anywhere through cloud technology. Recent advances in IT is the consequence of the development in computing systems.

Оставшееся время: 1 ч, 10 мин, 46 с

Business Review; authors Harold J. Leavitt and Thomas L. Whisler commented that "the new technology does not yet have a single established name. We shall call it information technology (IT)." Their definition consists of three categories: techniques for processing, the application of statistical and mathematical methods to decision-making, and the simulation of higher-order thinking through computer programs.

- A. ➤ Information technology is changing principally because of the changing needs

 A. True

 B. False
- B. ➤ The term IT refers only to computers and computing devices
- B. The main player in the field of modern IT is now the telephone, not the computer
- B. According to the author the

may fracture. The results of external forces are creep and fatigue.

<u>Compression</u> is a pressure causing a decrease in volume. When a material is subjected to a bending, shearing, or torsion (twisting) force, both tensile and compressive forces are simultan eously at work. When a metal bar is bent, one side of it is stretched and subjected to a tensional force, and the other side is compressed.

<u>Tension</u> is a pulling force; for example, the force in a cable holding a weight. Under tension, a material usually stretches, ret urning to its original length if the force does not exceed the material's elastic limit. Under larger tensions, the material does not return completely to its original condition, and under greater forces the material ruptures.

<u>Fatigue</u> is the growth of cracks under stress. It occurs when a mechanical part is subjected to a repeated or cyclic stress, such as vibration. Even when the maximum stress never exceeds the elastic limit, failure of the material can occur even after a short time. No deformation is seen during fatigue, but small localized cracks develop and propagate through the material until the

bolts and the deformation of components of machines and engines are all the examples of creep. In many cases the slow deformation stops because deformation eliminates the force causing the creep. Creep extended over a long time finally leads to the rupture of the material.

- A. True
 causing the elastic
 deformation of materials
 are tension, compression,
 torsion, bending, and
 shear
- Elastic deformation means changing the shape and size permanently
- B. The results of external forces are torsion and compression
- A. The result of extreme tension is rupture
- A. Y Fatigue can occur due to vibrations or stress
- A. Creep is a slow deformation of a material
- A. Y Creen usually hannens at

Read the text and decide whether the following statements are true or false

Reading 3. Smart home

The beginning of the 21st century saw a revolution in home-living with new technology changing the places where we live, from the wireless internet to TV screens that hang on walls, and it seems technology could be changing our homes again. A project conducted by Johann Siau, Senior Lecturer at the University of Hertfordshire's School of Engineering and Technology, builds on the University's InterHome project – aiming to create a home that monitors people living at home who are frail or elderly.

The INTERHOME. 'We've developed a wrist-band type device,' says Johann Siau, 'which allows us to monitor the condition of an elderly person, or whoever is wearing

smart house. The house stores the usage patterns of the person living there and can adapt to make it as energy efficient as possible. 'Linking the two together, and building the service element, allows us to introduce the assisted-living idea to care for the elderly. It's very important that these technologies are there to help and support rather than to replace any of the existing services.'

Built from zero. The InterHome is not just a prototype (a doll's house at the moment) or a vehicle for research, it's a study tool where students from a range of scientific disciplines get to learn and develop technology. The InterHome incorporates the latest broadband technology, mobile data and communication. Researchers and students make sure all the technology works together. 'We've used this to teach undergraduate students, as well as our postgraduate students, and gives us the flexibility to be able to design our systems because the hardware and software is developed in-house.' It requires a variety of skills from students – electronic engineers, embedded-system engineers, computer students, design students. 'The current plan we are working on is a smart home project in Watford with some commercial companies,' says Johann Siau. 'We are looking at how a smarter home can
